

Heatable stone relaxing chairs

*Enjoy the soothing
effect of warm
stones*

product information

our Material...

Mineralit is the brand name for a material that is also known in the trade as mineral casting. It consists of approx. 94 % natural quartz sand. This means that this material is initially basically a mineral conglomerate.

Mineral conglomerates are basic materials of the universe. They lie at our feet in the desert sands as in fertile farmland. We encounter them in the infinitely varied granite or marble as in countless, never repeating unique gemstones. Since time immemorial, man has tried to add his own artistic designs to these creations, challenged by nature's models. Since ancient Egypt, master builders and artists have been shaping, colouring and painting hewn, assembled or fired mineral structures.

heatable stone chairs

...for Aesthetics...

Mineralit heatable stone loungers are predestined for use in swimming pools and wellness areas. Their luxurious appearance and the noble sandstone surface make them a highlight in every recreation area. Mineralit can also be used to create whirl loungers that are adapted to individual conditions.

Do you have your very own idea of how your stone couch should look like? Then let us know your wishes and together we will work out a personal design for you.

In addition to the exclusive appearance, the particular advantage is that the lying surface can be heated because heating mats are incorporated under the surface. These can be adjusted to the most comfortable temperature by a temperature regulator. In this way, the positive effects of the warmth, such as muscle relaxation, stimulation of the blood circulation and general well-being, can be used optimally.

heatable stone chairs

... Wellbeing...

Heat promotes many health-promoting processes. One of the most important effects of heat is the deep relaxation of body and mind.

The feeling of rest and positive influences on regeneration create the basis for intensive relaxation.

The body reacts to the effect of the heat by dilating the vessels, the heat is distributed throughout the body. A better blood circulation is achieved. The increased blood circulation improves the supply to the cells, the heart rate is increased.

Heat stimulates healthy body parts and organs to increased activity. The entire metabolism, the entire processes of decomposition and conversion of food and oxygen are stimulated. The heat penetrates deep into the skin, the lymph flow is stimulated, the self-healing powers are stimulated and hardened muscles are made supple.

The entire organism is charged with new energy and vitality.
